

## **Stryker Announces On-Board ANPR**

Stryker Communications announces the launch of its On-Board Automatic Number Plate Recognition (ANPR) module for the IRIS Wireless Redeployable CCTV system.

The IRIS ANPR module is a 'snap-on' module which can be mounted on any IRIS camera unit. The IRIS ANPR enabled can receive database updates via mobile phone link (without the need for a PC) and will monitor for pre-determined licence plates. In the event of a 'hit' being detected, the system will automatically generate an alert sending details via SMS text message of the licence plate detected, time/date of detection and the location of the camera.

Responding to the needs of a number of Police authorities for vehicle monitoring in outlying areas not covered by existing surveillance infrastructures, Stryker undertook the development of IRIS ANPR in close conjunction with police users.

Stryker see the launch of this new product as another step forward in applying real intelligence to remote surveillance systems.
