

Stryker Announces True IP-Based Mobile Camera

Stryker Communications announces the introduction of a true IP-based mobile camera solution to its range of redeployable CCTV systems.

Stryker's IRIS wireless camera systems can now be provided as pure IP-compatible devices transmitting Mpeg2 images on an IP stream direct from the camera to a control room decoder, eliminating the need for multiple analogue-digital signal conversion and reducing latency.

Steve McCullen commented, "Many systems masquerade as IP systems but in the main they involve conversion of the video signal between analogue to digital formats a number of times across the transmission path, introducing unnecessary latency into the process. The latest addition to the IRIS range offers true end-to-end IP transmission".
