

Stryker blazes ahead with incident management solution

Fire-Ground Solution from Stryker

Stryker Communications, the wireless re-deployable CCTV surveillance specialist, has partnered with domo Limited and Avon Fire & Rescue Service to design and develop a new critical technology for improved incident management of fires.

The **Fire-Ground Solution** provides vital situational awareness information to command personnel, reducing the need for firefighters to describe the scene verbally and allowing them to concentrate on the job at hand.

The system comprises four Stryker rapidly deployable video cameras with self contained power supplies which can be attached to standard street furniture or mounted on top of an elevated fire platform. The cameras utilise domo's latest wireless digital video transmission technology to relay reliable, high-quality real-time video images of the fire scene back to the incident command vehicle even when there is no direct line-of-sight.

Within the vehicle, four pictures are displayed simultaneously and any of the images can be selected for display on a separate screen, allowing critical analysis of a transmitted scene. The camera functions such as pan, tilt and focus can be controlled from the vehicle and the images can be further distributed via a satellite up-link to the Fire Service Headquarters if required.
